

Improve Efficiency and Security

Integrate the same great public records services offered through our FICOSO website as a secure RESTful JSON API (Application Programming Interface) into your core internal software environment.

Streamline your workflow and get access to FCS' risk mitigation solutions inside your loan origination, banking, factoring, or other business software. Conduct your due diligence searches to flag potentially risky debtors, file UCCs directly from data already in your in-house system and monitor debtors to meet deadlines for retaining your position on collateral against Federal tax liens. Even upload prior filings to our system to simplify UCC continuations.

Eliminate the need to re-enter UCC information into a separate website and the need to provide staff handling sensitive information internet access. All transactions are conducted using common internet security protocols with TLS 1.2 or greater encryption to our secured, scalable, and high availability AWS platform.

Our API services include:

- UCC Search and file
- Business Search
- Monitoring of Debtors UCC/Lien activity and Business Entity changes
- Monitoring activity in US District Court, State Court, Bankruptcy Court records

End-User & Product Integration Support

Whether you are the end-user of these services, or want to offer search, file, and monitoring solutions in a SaaS or installed financial product, the FCS API can support your business model. We offer two-level credentials to identify both the integrator and billable client, along with references and pass-through information so that critical details that match the response to the original transaction can ride along and be returned to simplify coding.

Development & Test Environment

FCS API comes with a test API endpoint (also called a sandbox) so your developers can implement and test code against the same functions as our live systems. Submit filings, run searches on test data, and see results in the same form as production without accruing charges.

Each client receives access to the sandbox for the duration of our business relationship so you can implement, change and regression test your code throughout the software development and maintenance lifecycle. We also provide a working Postman environment and API call collection to verify you have connectivity and working examples of the API in use. For C# .NET developers source code is available to jump start your development with the classes and API calls already implemented as a Visual Studio solution package.

Our online documentation is updated regularly and includes information like workflow, mapping UCC form entry blanks to the API JSON data, and focused sections on filing situations such as real estate filings and tax stamps.

Service Workflow

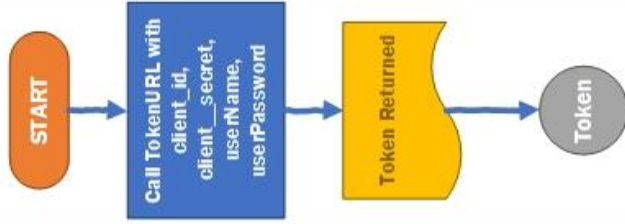

The following flowchart illustrates the basic workflow for each of the offered services. For more information, work with your FCS Sales team member to establish an NDA, and request access to detailed API documentation and sandbox.

You will need to provide names, email addresses, and the country where development is expected to occur if outside the US and Canada. If offshore, please also provide IP addresses so that we can provide developer access via whitelisting.
